Emergency responders expect dangers on the job; your workplace doesn’t have to be one of them.

The workplace of emergency responders is everywhere: indoors, outdoors and on the road. Your workplace is their workplace … is it safe?

- Darkness creates an unknown environment. Is sensor lighting in effect at your workplace?
- Malfunctioning alarms are far more than just a nuisance. They are dangerous for emergency responders who have to treat all alarm calls seriously. False alarms are only false in hindsight.
- Firefighters work with an amount of oxygen that is limited. Can they navigate through your workplace quickly and efficiently?
- Blocked exits are a death trap for everyone. Make sure exits are clearly marked and accessible.
- Are signs and guardrails in place for all potential hazards?
- During a medical emergency, paramedics need to make it in and out of work sites quickly. Are hallways and work areas clear of clutter and accessible for paramedics with loaded stretchers?
- Are alleys, roadways and parking areas accessible to emergency vehicles?
- During an emergency, it’s important that responders know what is stored where. Are materials safely stored and clearly marked?
- Emergency responders are unfamiliar with your workplace. Consider workplace safety from the point of view of someone who has never been there before.
